

# Dosimetry of patients injected with tracers Ga-68, Zr-89 and Lu-177

Bruno Vanderlinden

# What is NM speciality?

⇒ Multidisciplinary approach

# Plan

- What is a radiopharmaceutical and how to choose it
- An introduction to a dedicated dosimetry, the MIRD formalism and the pharmacokinetics
- Which equipment used in NM are required (radionuclide calibrator, gamma counter and gamma camera)
- A Presentation of some practical examples with Zr89 labelled to antibodies and octreotide labelled with Ga68 or Lu177

# Radiopharmacology

- Pharmaceuticals labelled to a radionuclide

- Hormone
  - peptide
- Antibody
  - rituximab

# Physical properties

- Physical half lives
  - Short  $\approx$  hours
    - $\Rightarrow$  Diagnostic
  - Long  $\approx$  days
    - $\Rightarrow$  Diagnostic for long biological half-lives
    - $\Rightarrow$  Therapeutics
- Types of emissions
  - Gamma
  - Beta
  - Alpha
- Energies of emissions
- Intensities of emissions
- Chemical properties (binding, mass,...)

# 68Ga diagnostic short half-life

1+  $^{68}_{31}\text{Ga}_{37}$  0.0 67.71 M 8  
 $Q(\text{gs}) = 2921.1 \text{ keV}$  12  
 $\epsilon: 100\%$

Annihilation

- Electron capture or beta + emissions (88%)
- 2 gamma after annihilation of beta +
- TVL = 17 mm Pb

# $^{89}\text{Zr}$ diagnostic long half-life

- Electron capture or beta + emissions (23%)
- 2 gamma after annihilation of beta +
- TVL = 32 mm Pb

# $^{90}\text{Y}$ therapeutic

- Beta- emitter
- half-life = 2.7 days
  - $^{90}\text{Zr}$  0+ could make a pair production => beta+ emission

Maximum Range of Beta in Air: 9 m

Maximum Range of Beta in Water: 11 mm

# $^{177}\text{Lu}$ therapeutic

$7/2+$  ——— 0.0 6.647 D 4  
 $^{177}_{71}\text{Lu}_{106}$   
 $Q(\text{gs})=498.3 \text{ keV } 8$   
 $\beta^- : 100 \%$

- Beta- emitter decay in Hf177 excited states
- half-life = 6.7 days
- Hf177 excited
  - Gamma emitter

113 & 208 keV

- Half-life < nanosecond
- TVL = 2.1 mm Pb

# Committee on Medical Internal Radiation Dose (MIRD)

- Radiation dosimetry provides the fundamental quantities used for radiation protection, risk assessment, and treatment planning.
- The MIRD Committee develops standard methods, models, assumptions, and mathematical schema for assessing internal radiation doses from administered radiopharmaceuticals.
- The virtue of the MIRD approach is that it systematically reduces complex dosimetric analyses to methods that are relatively simple to use, including software tools for experimental and clinical use.

# The MIRD Formalism

Absorbed fraction

$$f(x, E_0) = \frac{E}{E_0}$$

Absorbed fraction by mass

$$F(x, E_0) = \frac{f(x, E_0)}{dm}$$

Mean absorbed dose Gy [J/Kg]

$$\bar{D} = \frac{E}{dm} = \frac{f(x, E_0) \cdot E_0}{dm} = F(x, E_0) \cdot E_0$$

# Dose in a volume

$$D(k \leftarrow h) = \frac{E}{m_k} = \frac{\varphi(k \leftarrow h) E_0}{m_k} = \Phi(k \leftarrow h) E_0$$

- $D$  = mean dose in target volume
- if radiations are non-penetrating

$$\varphi_i(k \leftarrow h) = 0 \quad \text{if } k \neq h \quad \rightarrow \quad D(k \leftarrow k) = \frac{E_0}{m_k}$$

$$\varphi_i(k \leftarrow h) = 1 \quad \text{if } k = h \quad \rightarrow \quad D(k \leftarrow h) = 0$$

# Radionuclides

$$\dot{D}(t)_{(k \leftarrow h)} = A_h(t) E_0 \Phi(k \leftarrow h)$$

- mean dose rate in target k at time t for source h with one type of radiation of energy  $E_0$
  - if i is a specific type of particle with
    - $E_i$  its energy
    - $n_i$  the number of particles of type i emitted per transition
- $\Delta_i$  is the mean energy per transition for radiation i in J/(Bq.s), and  $\Delta$  the total energy per transition

$$\Delta_i = k n_i E_i \quad \Delta = \sum \Delta_i = K \sum n_i E_i$$

- the dose rate is the sum of all radiation types

$$\dot{D}(t)_{(k \leftarrow h)} = K A_h(t) \sum n_i E_i \Phi_i(k \leftarrow h)$$

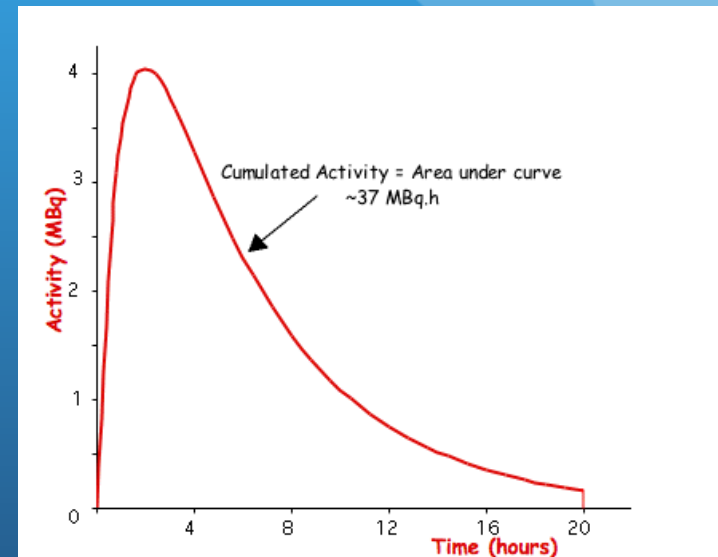

# Residence time

$$D_{(k \leftarrow h)} = \int_{t_1}^{t_2} \dot{D}(t)_{(k \leftarrow h)} dt = K \tilde{A}_h \sum n_i E_i \Phi_i(k \leftarrow h)$$

- $\tilde{A}_h$  is the cumulated activity

$$\tilde{A}_h = \int A_h(t) dt$$

$\tilde{A}_h$  = total number of transitions in source  $h$   
calculated from biological data (graphically or numerically)

- Residence time is different for each organ-source (diff pharmacokinetics)

$$\tau_h = \frac{\tilde{A}_h}{A_0}$$

# MIRD fundamental equation

$$D_{(k \leftarrow h)} = K \tilde{A}_h \sum n_i E_i \Phi_i(k \leftarrow h)$$

- the factors independent of time are included in the S-factor :

$$S_{(k \leftarrow h)} = K \sum n_i E_i \Phi_i(k \leftarrow h)$$

- MIRD simplified equation

$$D_{(k \leftarrow h)} = \tilde{A}_h \cdot S_{(k \leftarrow h)}$$

# S-factor

$$D = A_0 \tau S$$

- to obtain a dose from an initial activity one must know
  - the residence time
  - the S-factor for the specific geometry
- S-factors calculated using phantoms
  - mathematical : simplified
  - voxelized : from CT or MR data
- calculation methods
  - analytical
  - Monte Carlo

ANTERIOR VIEW OF THE PRINCIPAL ORGANS IN THE HEAD AND TRUNK OF THE PHANTOM

# Quantification

## Material

- Radionuclide or dose calibrator with a well-established conversion factor for the specific radionuclide and for the acquisition parameters used in routine (container geometry, position in the radionuclide calibrator, liquid volume,...)
- Gamma counter with a well-established conversion factor for specific radionuclide and for the counting parameters used in routine (activity range, volume of liquid, standard vial ...)
- Gamma camera SPECT-CT with a well-established conversion factor for specific radionuclide and for the acquisition parameters used in routine (type of collimator, energy window, activity range,...)
- Imaging processing software (fusion tool, delineation)
- Dosimetry software : Olinda software (provided by MIRD committee)

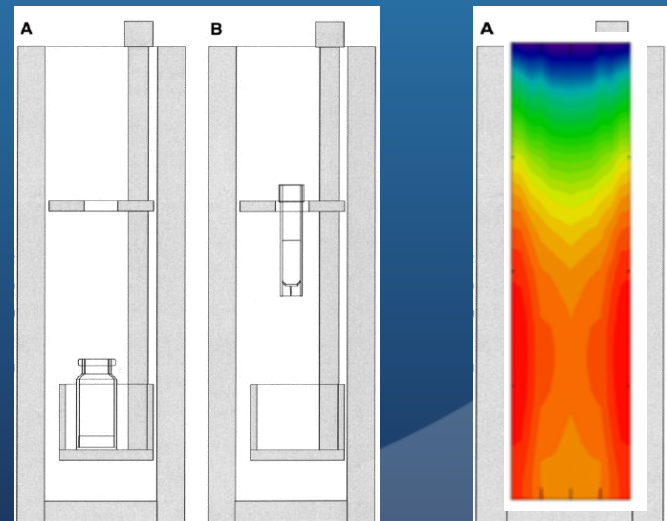

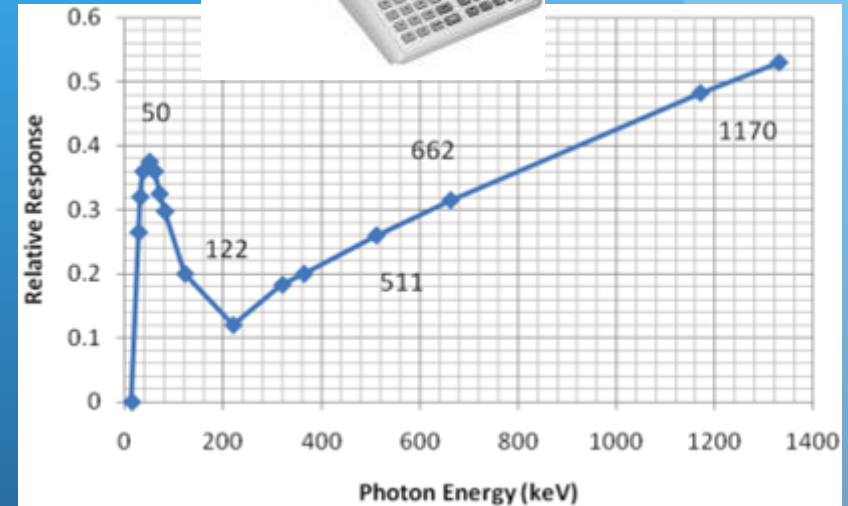

# Radionuclide calibrator

+

- Wide energy range
- Wide counting range
- Convenient open geometry

-

- No energy spectrum
- Geometry dependent
- Calibration with a limited set of radionuclides and geometries

Institut Jules Bordet

# Gamma counter

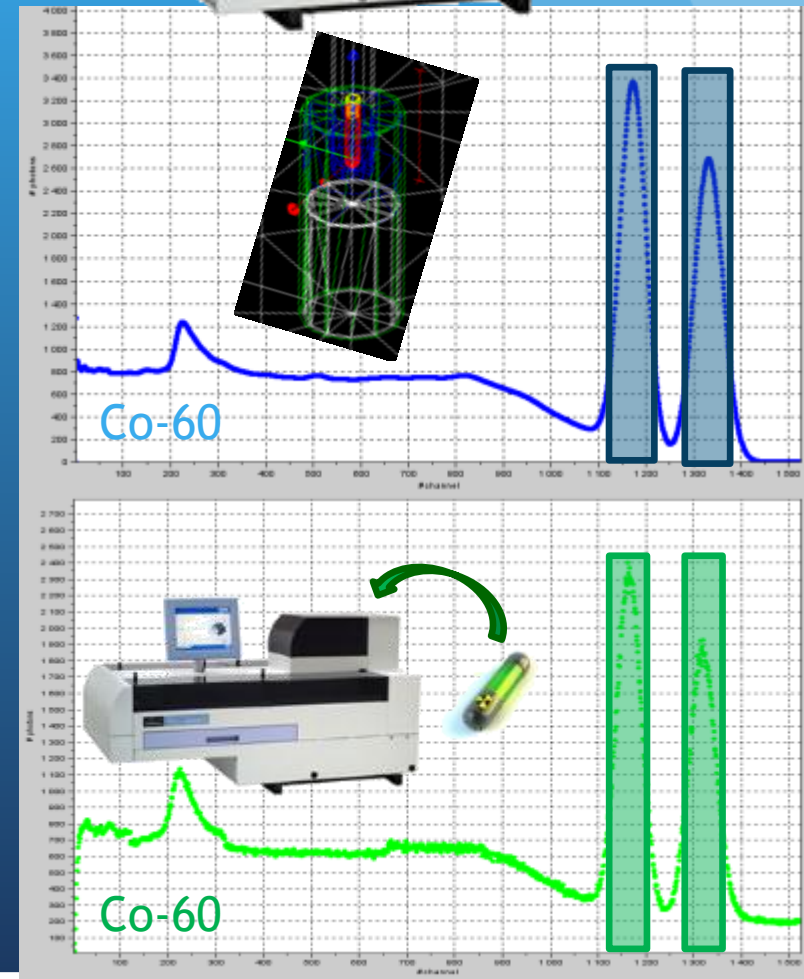

+

- Energy spectrum
- Geometry non-dependent

⇒ Montecarlo simulation

—

- Small counting range
- Non convenient
- Closed geometry

Institut Jules Bordet

# SPECT/CT

+

- Energy spectrum
- Open geometry

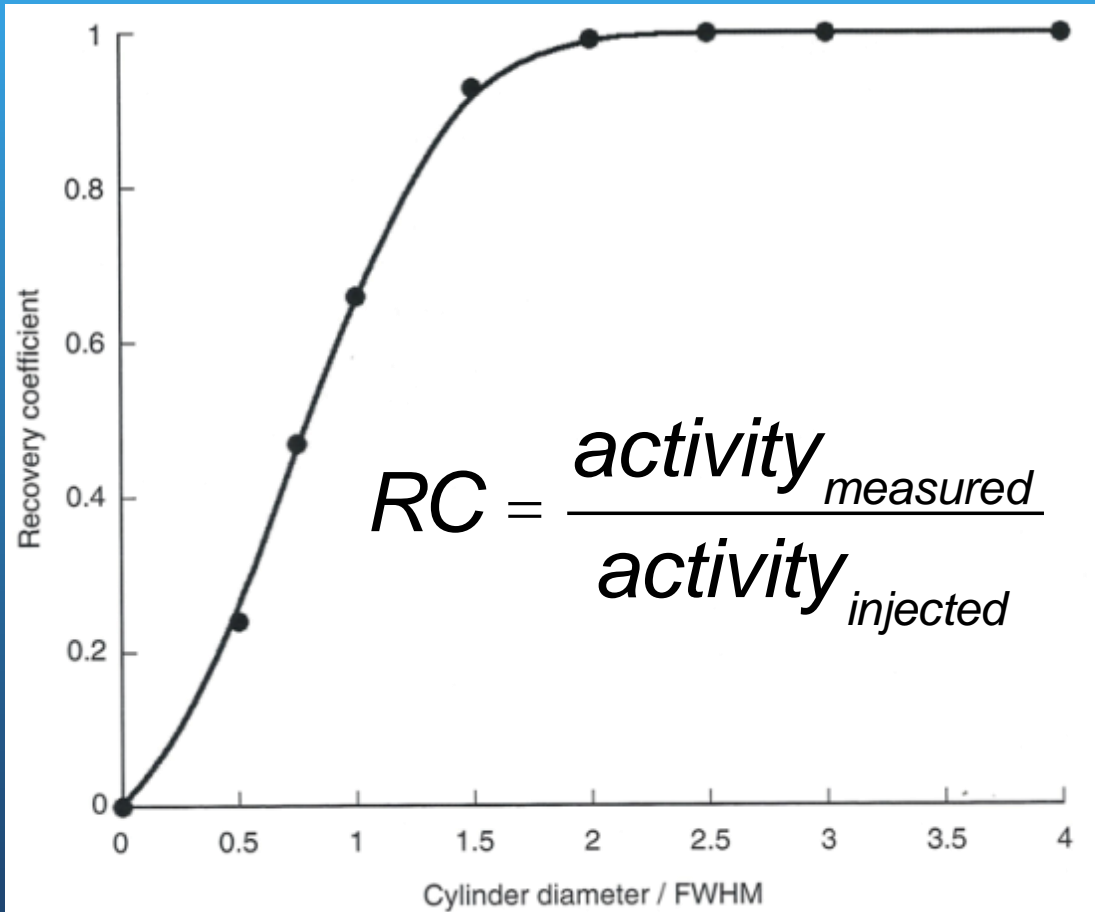

—

- Collimators
- No vendor calibration
- Low resolution

# Partial volume effect

Institut Jules Bordet

# PET/CT

+

- High resolution
- High sensitivity
- Calibrated for positron counting
- Self collimation
- Time of flight

—

- Irradiate the patient and the worker
- Equipment and radionuclide expensive

# Processing software

Institut Jules Bordet

- Fusion
  - Different modalities
- Contouring
  - Different modalities
- Conversion & correction
  - Counts to activities or dose
  - Partial volume effect
- Exporting
  - Statistic
  - contouring

# Dosimetry software: olinda

Institut Jules Bordet

- Choose the isotope and phantom to determine S-factor
- Insert the residence time calculated with the statistics obtained (which integration?)  
=> the dose table

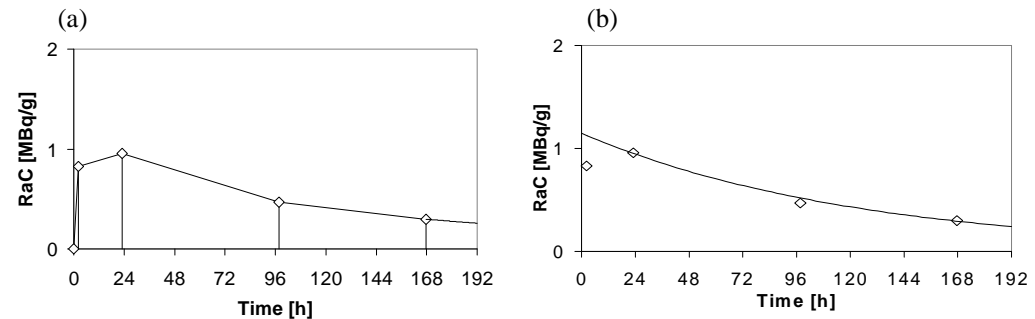

Figure 6: Typical kidney clearance curve integrated with the trapezoid method (a) or exponential fit method (b) in a patient treated with  $^{177}\text{Lu}$ -octreotate.

# Quality Assurance

- Standard Procedure :
  - to optimize the reproducibility of the measurements
- Quality control of the equipment
  - to keep the calibrations
  - to evaluate systematic and stochastic errors
  - to evaluate the derives

# Immuno-PET/CT

Institut Jules Bordet

- Immuno-PET/CT combines the high sensitivity of PET/CT with the specificity of the chimeric monoclonal antibody (mAb) for the antigen expressed on the surface of cancer cells.
- Zirconium-89 is a positron emitter with a half-life of 78.4 hours, which is compatible with the time needed for intact mAb to achieve optimal tumour-to-background ratios.
- Antibody half life in blood 2-4 day

## $^{89}\text{Zr}$ -rituximab Immuno-PET/CT

1 hour p.i.

1 day p.i.

3 days p.i.

6 days p.i.

# Immuno Dosimetry : Zr89 to Y90

$^{89}\text{Zr}$ -rituximab Immuno-PET/CT  
Antibody half life in blood 2-4 day

1 hour p.i.

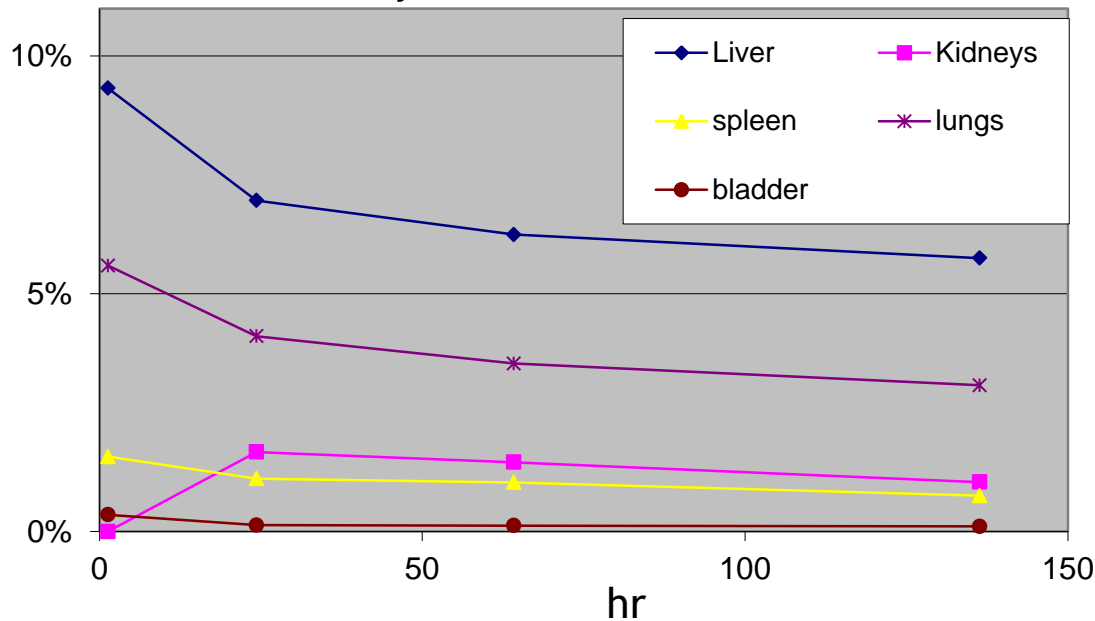

1 day p.i.

3 days p.i.

6 days p.i.

% Zr89 initial Activity

- % Zr89 is converted in % Y90 in function of her decay
- The Number of Y90 decay is the AUC + Y90 decay for the time remaining

# Immuno Dosimetry : Olinda 1.0

Institut Jules Bordet

# Tracer: wich octreotide for therapy?

4500 MBq  $^{177}\text{Lu}$  DOTA -NOC

6500 MBq  $^{177}\text{Lu}$  DOTA -TATE

**Figure 5.** Peptide receptor radionuclide therapy using  $^{177}\text{Lu}$  DOTA-TATE and  $^{177}\text{Lu}$  DOTA-NOC in the same patient (scans are scaled to the maximum pixel of both scans).

# Which Marker for therapy ?

- Y90
  - Beta- emitter
  - half-life = 2.7 days
- Lu177
  - Beta- emitter decay in Hf177 excited states
  - half-life = 6.7 days
  - Hf177 excited
    - Gamma emitter  
113 & 208 keV
    - Half-life < nanosecond

# Conclusion

- Patient Specific internal dosimetry in NM is achievable
- With systematic and stochastic errors
- We need robust and reproducible multidisciplinary methodology that allow :
  - to estimate stochastic errors
  - to correct systematic errors (even retrospectively)
